# 1. Overview & Purpose

This document defines the official airport identification system used on the server. Every airport on the server is identified by a **unique four-letter code** that is derived directly from its world coordinates. The system guarantees that within every 50 x 50 block square on the map there is **exactly one airport code** that can cover it, ensuring no two airports can ever share an identifier and no region is left undefined.

## 1.1 Core guarantees

Every 50 x 50 block square maps to exactly one 4-letter code.

Two airports more than 50 blocks apart in either axis always have different codes.

Codes are computed, not assigned - any player can derive the code of a location themselves.

The full code space covers 456,976 possible codes (26<sup>4</sup>).

## 2. How Codes Are Derived

The world is divided into an infinite grid of 50 x 50 block squares. The square whose centre sits on the world spawn point, **(501, -1303)**, is given the code **AAAA**. Moving east (increasing X) advances the first two letters; moving south (increasing Z) advances the last two letters. Moving west or north subtracts from the letters.

### 2.1 Step-by-step calculation

#### *Step 1 - Find the X region index*

```
rx = floor((X - 501 + 25) / 50)
```

#### *Step 2 - Find the Z region index*

```
rz = floor((Z - (-1303) + 25) / 50)
```

#### *Step 3 - Wrap into letter range*

```
a = rx mod 676,    b = rz mod 676  (negative values wrap via modulo)
```

#### *Step 4 - Encode each value as two letters*

```
letter pair = (A + a/26) + (A + a mod 26)
```

#### *Step 5 - Concatenate*

```
code = X-pair + Z-pair
```

The modulo wrap keeps every region index inside the two-letter range (0-675) while negative coordinates fold in naturally. Because region indices repeat every 676 regions per axis, a unique code is guaranteed across any contiguous run of 676 regions - a span of roughly **±16,900 blocks per axis** around spawn. In practice, every reachable build area is covered.

### 2.2 Where coordinates are taken from

The airport code for any airport is computed from coordinates taken **at the middle of the airstrip or helipad**, or at a point in close proximity to that middle. The code of an airport is defined by its operational surface centre, not by its terminal, hangars, or any decorative corner of the build.

Airstrip: stand on the centre of the runway and use those X/Z coordinates.

Helipad: stand at the centre point of the pad's landing circle and use those X/Z coordinates.

"Close proximity to the middle" means within a few blocks of the true centre; the exact centre is preferred whenever it is reachable.

If the middle is obstructed (e.g. covered by water or bedrock), take the nearest reachable block and note the offset in the registration record.

### 3. The Code Grid

The grid is aligned to the coordinate axes and anchored at spawn. Each 50 x 50 square is an independent region with a hard, enforceable boundary. The following table shows how the X region index maps to its letter pair for the areas closest to spawn.

| Z\X ->  | 301  | 351  | 401  | 451  | 501  | 551  | 601  | 651  | 701  |
|---------|------|------|------|------|------|------|------|------|------|
| Z -1103 | ZWAE | ZXAE | ZYAE | ZZAE | AAAE | ABAE | ACAE | ADAE | AEAE |
| Z -1153 | ZWAD | ZXAD | ZYAD | ZZAD | AAAD | ABAD | ACAD | ADAD | AEAD |
| Z -1203 | ZWAC | ZXAC | ZYAC | ZZAC | AAAC | ABAC | ACAC | ADAC | AEAC |
| Z -1253 | ZWAB | ZXAB | ZYAB | ZZAB | AAAB | ABAB | ACAB | ADAB | AEAB |
| Z -1303 | ZWAA | ZXAA | ZYAA | ZZAA | AAAA | ABAA | ACAA | ADAA | AEAA |
| Z -1353 | ZWZZ | ZXZZ | ZYZZ | ZZZZ | AAZZ | ABZZ | ACZZ | ADZZ | AEZZ |
| Z -1403 | ZWZY | ZXZY | ZYZY | ZZZY | AAZY | ABZY | ACZY | ADZY | AEZY |
| Z -1453 | ZWZX | ZXZX | ZYZX | ZZZX | AAZX | ABZX | ACZX | ADZX | AEZX |
| Z -1503 | ZWZW | ZXZW | ZYZW | ZZZW | AAZW | ABZW | ACZW | ADZW | AEZW |

Codes around spawn (green = AAAA, the spawn region). West/north are negative.

#### 3.1 Reading a code

A code such as **BQHZ** reads as two halves: the X-region pair **BQ** followed by the Z-region pair **HZ**. The X half always comes first. This makes codes predictable and sortable - sorting all codes alphabetically sorts the map from west to east first, then north to south.

## 4. Regulations: Siting & Boundaries

The following regulations govern where airports may be placed and how their boundaries are defined. Compliance is mandatory for all airports on the server.

### 4.1 One airport per code region

Each 50 x 50 block square is entitled to **exactly one primary airport** carrying the code of that square. No two airports may hold the same code. If a region already has an airport, a second airport must be placed in an adjacent region and must use that region's code.

### 4.2 Boundary definition

An airport's legal boundary is the full 50 x 50 square of its code region, from the region's minimum corner to its maximum corner inclusive. All runways, terminals, taxiways and aircraft parking must fall inside this square unless a written exception is granted.

### 4.3 Reference point for the code

The airport's code is determined exclusively by the coordinates of the **middle of the airstrip or helipad** (or a point in close proximity to that middle). Moving the runway or pad moves the reference point, and if it crosses a region boundary the airport's code changes. The reference point is recorded at registration and must not be changed without re-registration.

### 4.4 Buffer and clear zones

A 5-block clear zone shall be maintained around the perimeter of every runway.

A 10-block protected airspace corridor shall extend from each runway end in line with the runway heading.

No hostile mob spawners, water, or unlit areas may be placed within the clear zone.

### 4.5 Overlap disputes

If a build straddles two regions, the code used shall be the region containing the runway threshold (the end of the runway where landings begin). Disputes are settled by server administration; the map grid is definitive.

## 5. Regulations: Airports on the Ground

### 5.1 Runway standards

| Standard                | Requirement                                          |
|-------------------------|------------------------------------------------------|
| Minimum runway length   | 30 blocks (enclosed) / 50 blocks (open-air)          |
| Runway width            | 4 blocks minimum, 6 blocks recommended               |
| Runway alignment        | Parallel to X or Z axis (no diagonals)               |
| Threshold marking       | Block of gold/concrete at each runway end            |
| Designated landing side | West-to-east or north-to-south unless exempted       |
| Runway material         | Same block type on both ends; distinct from taxiways |

### 5.2 Terminal and infrastructure

The main terminal must display the airport's 4-letter code, at least 3 blocks high, visible from the runway.

A code plaque (sign or item frame) shall be placed at the spawn-side corner of the region.

Taxiways must be at least 2 blocks wide and may not cross runways at the same elevation.

### 5.3 Parking and hangars

Aircraft storage within a region shall not obstruct the clear zone. Shared parking between adjacent regions is permitted only with both airports' agreement and must not block a region boundary more than 5 blocks wide.

## 6. Regulations: Airspace & Flight

These regulations apply to all aircraft operations. They exist to keep traffic flowing and to protect the boundaries between regions.

### 6.1 Takeoff and landing

Landings and takeoffs must occur on a runway within the airport's region, staying inside the region's 50 x 50 footprint.

Aircraft must climb to altitude before crossing into the next region to avoid low-level intrusion.

Right-of-way is given to landing aircraft over departing aircraft.

### 6.2 Corridors and routing

Cross-country flights should follow straight lines between airport codes. Pilots may read their position by re-entering coordinates at any time; if the code changes, the region boundary has been crossed.

### 6.3 Restrictions

Flying below build height (Y=64) is prohibited except during approach or departure.

Sonic-boom / fast-travel devices may not be used over another region's airport without permission.

Airports may not be used as a base for combat or grieving of adjacent regions.

## 7. Regulations: Administration & Compliance

### 7.1 Registration

All airports must be registered with the airport code derived from their coordinates. No player may assign a custom or manual code. Registration records the code, the region boundaries, and the responsible player.

### 7.2 Changes and relocation

If an airport is moved so its reference point - the middle of the airstrip or helipad - crosses a region boundary, its code changes automatically to the new region. Builds that move more than 50 blocks in one coordinate must re-register under the new code. A runway that is extended must keep its centre within the region it is registered to.

### 7.3 Violations and enforcement

| Offence                                  | Penalty                                   |
|------------------------------------------|-------------------------------------------|
| Using another region's code              | Code revoked; airport re-registered       |
| Blocking a region boundary               | Structure ordered removed within 48 hours |
| Building in another airport's clear zone | Building ordered moved; damages owed      |
| Refusing to display the code             | Airport marked unregistered               |

Repeated violations may result in the airport being delisted and its region assigned to the next qualified applicant.

## 8. Worked Examples

The following examples walk through the calculation for real locations, using the steps from Section 2.

| Location                           | X    | Z     | Code |
|------------------------------------|------|-------|------|
| Example A - World spawn            | 501  | -1303 | AAAA |
| Example B - Near spawn, north-west | 350  | -1400 | ZXZY |
| Example C - Far east               | 2000 | -1303 | BEAA |
| Example D - Deep south-west        | -800 | 600   | ZABM |

### *Example A - World spawn*

**(501, -1303) -> AAAA**

### *Example B - Near spawn, north-west*

**(350, -1400) -> ZXZY**

### *Example C - Far east*

**(2000, -1303) -> BEAA**

### *Example D - Deep south-west*

**(-800, 600) -> ZABM**

## 9. Code Reference Tables

This section lists the letter pairs used for X and Z regions. The first half of any code uses the X table, the second half the Z table.

### 9.1 X-region letter pairs (west to east)

| Pair     | Value        | X range  | Pair         | Value | X range |
|----------|--------------|----------|--------------|-------|---------|
| AA ( 0)  | +476..+525   | AN ( 13) | +1126..+1175 |       |         |
| AB ( 1)  | +526..+575   | AO ( 14) | +1176..+1225 |       |         |
| AC ( 2)  | +576..+625   | AP ( 15) | +1226..+1275 |       |         |
| AD ( 3)  | +626..+675   | AQ ( 16) | +1276..+1325 |       |         |
| AE ( 4)  | +676..+725   | AR ( 17) | +1326..+1375 |       |         |

## 10. Appendix: Quick Reference Card

A compact summary of everything you need to use the airport code system.

| Item                         | Value                                             |
|------------------------------|---------------------------------------------------|
| Region size                  | 50 x 50 blocks                                    |
| Spawn anchor (code AAAA)     | 501, -1303                                        |
| Code format                  | 4 letters: XXZZ (X region, then Z region)         |
| Reference point              | middle of the airstrip / helipad (or close to it) |
| X region index               | $rx = \text{floor}((X - 501 + 25) / 50)$          |
| Z region index               | $rz = \text{floor}((Z - -1303 + 25) / 50)$        |
| Letter encoding              | base-26, A = 0; negative indices wrap (mod 676)   |
| Unique coverage around spawn | 16,900 blocks per axis                            |
| Total code space             | 456,976 codes                                     |
| Maximum one primary airport  | per 50 x 50 region                                |
| Runway minimum length        | 30 blocks enclosed / 50 open-air                  |
| Clear zone                   | 5 blocks around every runway                      |

### Quick examples

| Coordinates        | Code |
|--------------------|------|
| 501, -1303 (spawn) | AAAA |
| 300, -1303         | ZWAA |
| 700, -1303         | AEAA |
| 1100, -1303        | AMAA |
| 1500, -1303        | AUAA |
| -200, -1303        | ZMAA |
